Empowerment of BI Solution

## YOUR ENTERPRISE PROJECT MANAGEMENT SOLUTION. HOW TO GET MORE FROM IT?

The same improvements that Business Intelligence has provided for Sales, Marketing, IT, and Finance can be provided for Project data.

Project Server is an excellent tool for planning and tracking project implementations. The reporting database and the reports that are part of the Project Server SDK provide a tactical view of the projects.

However, to understand the reports, users need to have a detailed understanding of project management. Not everyone is clear how a project aligns to the business goals.

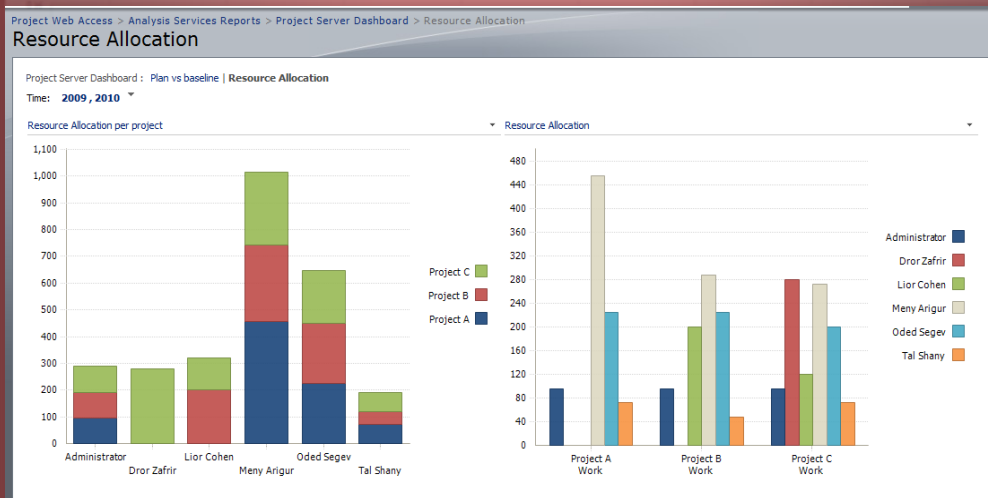

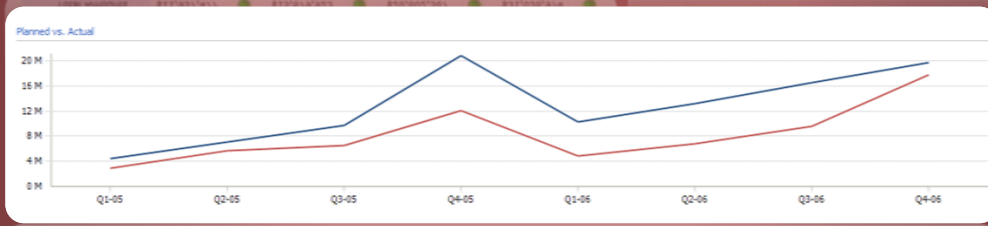

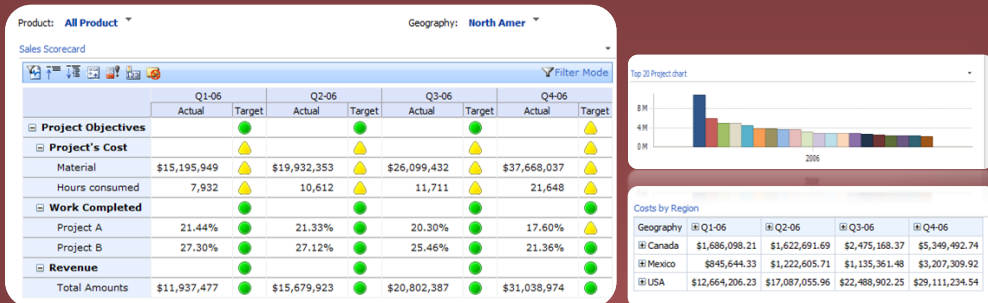

PerformancePoint Server enables a broader user community to access the data by aligning projects with objectives, integrating data from other data sources, establishing targets, and providing navigation paths through the data.

# BPMK integrated solution

## Key Benefits

The multidimensional database provides a fast and flexible access to the data. Users can further investigate the data instead of relying on fixed pre-built rational reports.

Project management can use PerformancePoint to create KPIs, scorecards and dashboards that encompass their expertise, thereby making it possible to share their knowledge with a wide user community.

Other data not stored in Project Server can be added to the PerformancePoint Designer application, giving users a much broader view of the project's health and impact.
